PATENTED.
PURISTIC.
NATURAL.

An exclusive sanctuary that inspires an allure like no other

A pool in the garden is more than an oasis.

It is an ideal place to enjoy the love of life, luxury and freedom. It subdues the elemental force of water, and in the best case, perfectly unites it with the architecture of its surroundings.

The distinctive features of a Kusserpool combine the beauty of natural stone with the clarity of water. It emphasizes the natural color of water and the depth of the granite's structure giving a unique appearance. The Kusserpool becomes a unique resting area with irresistible charm.

While one person will want to immediately jump into the cool water, another may take their time and enjoy the calming effects of the combination of natural stone and water. The Kusserpool offers the desire to swim and relax in a mountain lake.

The use of pure granite is the main theme of this property. The natural stone contributes to its exclusivity, elegance and beauty. The centerpiece of this home is the outdoor area; the pool, terrace and garden come together in subtly balanced unity.

A Kusserpool is not only a recreational area, the Kusserpool provides a harmonious flow between water and garden, combining the outdoors and the living area.

POOL SIZE:

32.8 x 9.84 ft, depth: 4.43 ft

TYPE OF POOL:

Overflow pool with granite overflow gutter

WATER TREATMENT:

Ospa

HEATING:

Air-to-water heat pump

ROLLER SHUTTER COVERING:

Solar roller shutters, silver metallic

OTHER FEATURES:

Countercurrent system

Illumination

When the water lies absolutely still in this 4.43 ft deep granite pool, it acts like a giant mirror highlighting the architecture of the residence.

During the day the distinctive stone and purist architecture is perfectly framed by the lushness of the garden. At night the warm glow from the residence, combined with the pool illumination, provides a romantic ambiance. The Kusserpool harmoniously completes this picture.

The pool lighting is integrated into the solid granite.

Individually designed with the latest technology

Self-supporting components allow the pool to be constructed flush with the ground or free-standing without additional support structures. The specially developed modular design permits the most modern techniques of installation without visible joints, artificial sealants or extensive veneers. Modular prefabrication in our factory ensures high-quality workmanship and fast installation on the customer's property.

Exclusive design, clear advantages

- Shimmering water color
- Solid granite
- Natural materials
- Self-supporting construction
- Puristic details
- Short construction time
- High-quality workmanship
- High flexibility

Classic or unorthodox — our pool shapes

With a completely new design, the Kusserpool can be created according to your needs and ideas. Whether a skimmer, overflow or infinity pool, shaped in a classical rectangle or free form, it is limited by only your imagination.

Skimmer pools

With the water level 1.97 to 7.87 in below the upper edge of the pool, the skimmer components are incorporated directly into the solid granite and are visually discreet in the background. With its simple construction and cost benefits, another advantage of the Kusserpool skimmer version is the low level of water noise even while the filter pump is running.

Infinity pools

The infinity pool is undoubtedly a visual highlight. Usually installed on a slope, it provides an unobstructed view of the surrounding landscape. Adding an infinity gutter to any pool wall offers a high degree of creative freedom.

Overflow pools

An absolutely smooth water surface is created by the overflow concept. Water continually flows over the edges into a circulating gutter system, allowing any floating debris to be removed quickly and efficiently. The gutter can be made from solid granite to blend into its surroundings. Although the height of the water level can be freely selected, when the water level is flush to the edge, it results in the impression of an infinite water surface.

With the continual flow of water over the edges of the Kusserpool, the floating debris is constantly being removed.

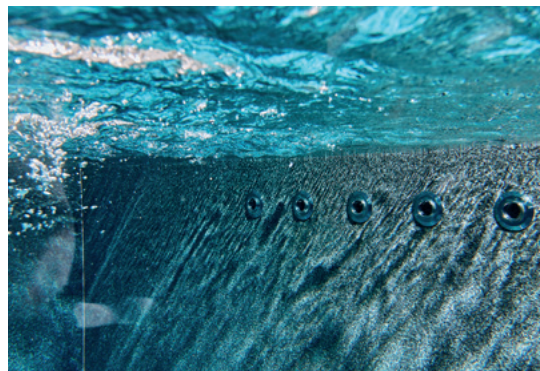

Aesthetic details and the highest quality of workmanship

The Kusserpool demonstrates quality with its detailed aesthetic and purist form. All parts are incorporated directly in the solid granite and do not require extensive coverings. Built-in and add-on parts, such as stairs, overflow gutters

and gutter covers, also can be made of granite. The specially-developed modular design enables construction with nearly invisible mortar joints and artificial sealant.

Massage jets and counter current system

Along with sporting and exercise activities, pools with massage jet areas offer a place for rest and relaxation. The massage jets can be incorporated into the solid granite, molded and installed at any desired position in the pool, allowing unlimited design possibilities contributing to overall wellness and regeneration.

Illumination

Whether you decide on one color or prefer the limitless possibilities of RGBW lighting, illumination has a great impact on the appearance of a pool. Lamps and spotlights can be integrated into the solid granite to contribute favorably to the visual appearance.

Staircase module

For entering the cool blue water, one can choose between a simple ladder or any of the different staircase designs. Produced from the same natural stone materials, the stairs fit perfectly into the water landscape.

Nearly any design is possible, whether space-saving corner steps or an entrance with sitting and lying areas.

Roller shutter covering

The roller shutter merely floats on the water surface, protecting against evaporation and heat loss. When not in use the roller shutter package is stored either under a bench or in a small cove at the end of the pool.

From design to installation

Besides the production of pools, Kusser offers their customers design, static measurement, and the delivery and installation of pools. Factory production guarantees high-quality workmanship in respect to each and every pool. On request, we can arrange a test run so that the customer can view and inspect the pool in our factory.

Individual technical design

The foundation of a successful pool project is a detailed technical design and an initial cost estimate completed in an early phase of the project. To achieve a harmonious overall design Kusser includes additional designers to be involved in the technical design of the pool.

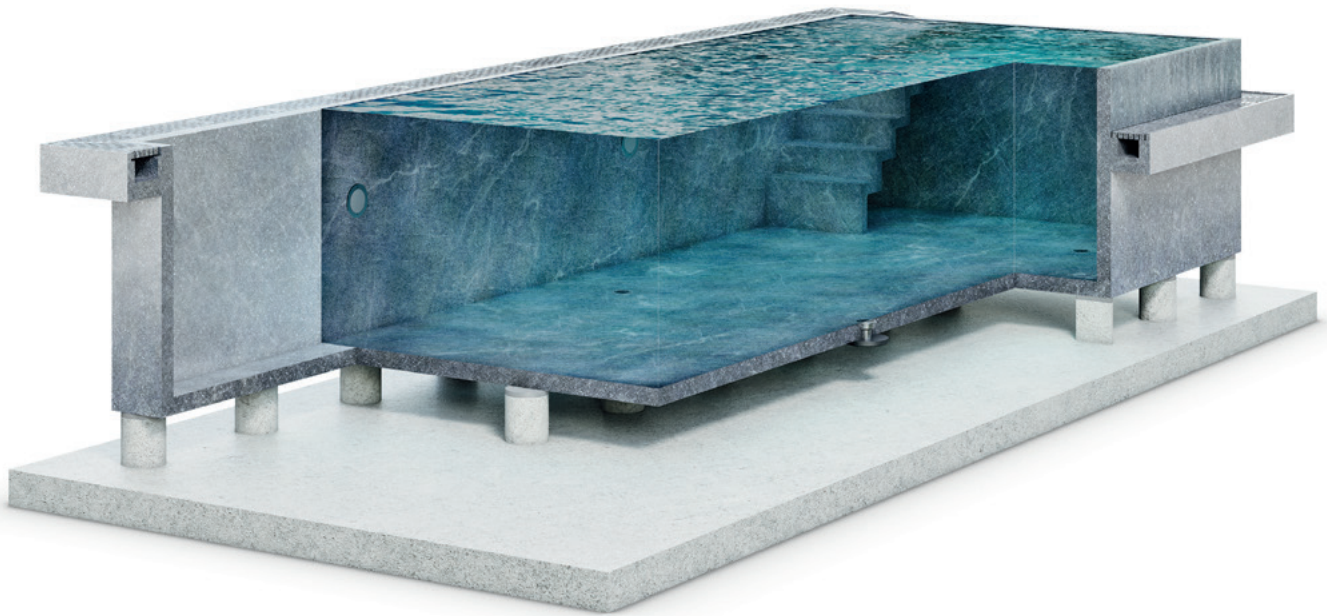

Our drawings are created in CAD format, displaying the pool in all its details. This facilitates an accurate calculation of the costs with precise planning of all fittings and features.

This allows for the pool project to be executed exactly according to the desires and specifications of the customer.

Precise factory production

The Kusserpool is prefabricated, assembled and tested for leaks in the factory. This ensures a short construction time on the customer's property, without the long setting times typical of concrete structures. The specially developed modular design enables construction without visible mortar joints and artificial sealant.

The pool consists of solid granite slabs with several square feet of surface, bonded together at the factory.

Delivery and final installation

After quality inspection the entire pool with predefined fittings is transported on a flatbed truck to the customer and installed on the premises. In cases where access or installation is difficult, or where pools exceed the normal width, the pools are fabricated in modules. The size of individual parts of the pool is selected with consideration to the prevailing installation situation and viability to handle properly.

Large granite modules are assembled on site. Typically, the pool is placed on a stable concrete slab. The rigidity needed for the concrete foundation depends on the building site, which is why the foundation of the pool must be planned in advance.
